

Abstract

An article attachment system is disclosed for a vehicle having one or more receiving members. The system includes a base having an attachment device to couple and uncouple the base with the receiving member. The base is configured to interchangeably receive an article and includes a retention device to selectively retain and release the article. A universal mounting adapter is also disclosed for interchangeably attaching articles to a receiving member and includes a base adapted to couple to the receiving member, a selectively deployable attachment device adapted to engage a portion of the receiving member and couple the base to the receiving member, an article interface to couple an article to the base, and a retention device between the article interface and the base.
